Abstract of the Disclosure

3

4 With a device for supplying a process chamber with fluid media having at least

5 one delivery line (17), that has a supply opening (18), and with sealing elements

6 (15, 19) that are associated with the supply opening (18), a great deal of effort is

7 required to load the process chamber and remove therefrom the material that is

8 produced. Rapid and uncomplicated loading of the process chamber or removal

9 therefrom of the material that is produced is enabled using tensioning

10 mechanisms (30, 31) for holding the delivery line (17) against a receptacle (15) of

11 the process chamber (10) that is associated with the supply opening (18).
